

How I Approached the Role

Self-Assessment: Product Management Job Simulation (Mobile Gaming)

Shashank Sharma | Completed September 22, 2026

Summary

In this simulation I worked as a mobile gaming product management intern. I completed both practical tasks, analyzing product performance through KPIs and planning a presentation of the insights for stakeholders, and earned the Certificate of Completion. Below is how I approached the work and the qualities I aimed to show as a team member.

What Made My Work Strong

- **Data-driven thinking.** I started from the numbers, choosing KPIs that reflect product health and asking what each one says about player behavior before drawing conclusions.
- **Focus on insight, not just data.** I aimed to go beyond reporting metrics and explain what they mean and what the team should do about them.
- **Audience-first communication.** When planning the stakeholder presentation, I organized the message for busy leaders: the main takeaway first, evidence to support it, and clear next steps.
- **Clarity and structure.** I kept the story simple and logical so a non-technical audience could follow it and act on it.
- **Ownership and follow-through.** I worked through the program independently and self-paced, finished every task, and completed it within September 2026.

Key Takeaways

- Good product decisions come from linking KPIs to real player behavior.
- The best analysis is only useful if leaders can understand it quickly.
- Tailoring the message to the audience is as important as the analysis itself.

How I Would Apply This in a Real Team

- Track a focused set of KPIs and review them regularly rather than chasing every metric.
- Bring findings to stakeholders with a recommendation, not just a chart.
- Stay curious, ask questions early, and adjust based on feedback.

This self-assessment reflects my experience in a Forage virtual job simulation, an educational program, and not paid employment.
